

ABSTRACT

A system including a mobile communication terminal and a car mounted electronic device. The mobile communication terminal includes a first interface for making radio communication with a mobile communication network, a second interface for making radio communication with the car mounted electronic device, a first connection control section for controlling connection to the car mounted electronic device, and an information transfer section configured to transmit a control signal including a restraining command to the car mounted electronic device. The car mounted electronic device includes an interface for making radio communication with the mobile communication terminal, a second connection control section for controlling connection to the mobile communication terminal, and a mute control section configured to restrain an output of information specific to the car mounted electronic device based on a restraining command received from the mobile communication terminal.
